

Kitewing 3.0

<https://vimeo.com/182877422> Note: MOV shows proto type wings.

The Kitewing 3.0 is a light weight wing which is easy to sail. That doesn't mean the diminutive 3.0 will fail to stimulate expert sailors.

Sporting the latest frame geometry designed to make the wing easier to handle with a very full wing section the Kitewing 3.0 is a quick and responsive wing. Ice sailing on skates the 3.0 is all the sail most folks want.

The light weight of the Kitewing 3.0 make this wing an excellent light air sail when it is used with skates or roller blades. The 3.0 wing sails by itself at very slow velocities. The 3.0 is not a power wing. It may not be the best choice in sticky conditions or for sailing on snow.

The Kitewing 3.0 is built from Dacron with a reinforced mylar window. The 3.0 can be stowed on the frame. The 3.0 sail comes standard with shock chord batten retainers and a long reflex strap which can be X rigged. the 3.0 sail is the first Kitewing to incorporate leech stabilizers by Ezzy.

The frame is built from the same quality components as the other wings with composite fiberglass front tubes.

Shows longer reflex strap X rigged through two sets of grommets.

Reflex strap X rigged
